

1. Five Cyber Security Threats

1. **Phishing** – Fake messages or websites trick users into giving login details. *Example:* A fake Instagram login link sent by email.
 2. **Malware** – Harmful software that can steal data or damage a device. *Example:* Downloading a fake WhatsApp APK from an unknown website.
 3. **Ransomware** – Malware that locks files and asks for money to unlock them. *Example:* A company loses access to its data after a ransomware attack.
 4. **Data Breach** – Personal information is leaked after attackers access company databases. *Example:* Customer information leaked in the **MobiKwik (2021)** incident.
 5. **DDoS Attack** – Attackers flood a website with traffic to make it unavailable. *Example:* An online shopping website becomes unavailable during a DDoS attack.

2. Fake Login Page (HTML)

Explanation:

A fake login page looks similar to the real Instagram login page and tricks users into entering their username and password. Users can identify phishing by checking the website URL, looking for HTTPS, and avoiding suspicious links received through email or messages.

3. Short Report (About 170 Words)

In **2022**, **AIIMS Delhi** suffered a major ransomware attack that disrupted many hospital services. The attackers infected computer systems with ransomware, making important files and medical records inaccessible. As a result, several hospital services were affected for many days, and staff had to use manual processes while the systems were being restored.

Cybersecurity experts and government agencies investigated the incident and worked together to recover the affected systems. Backups were used where available, infected devices were isolated, and security measures were improved to prevent similar attacks. The incident highlighted the importance of regular software updates, strong passwords, network monitoring, employee awareness, and secure backups. It also showed how ransomware can seriously affect organizations that provide important public services.

Today, many organizations use multi-factor authentication, regular security audits, and backup strategies to reduce the impact of such attacks.

4. Poster Content (Phishing)

Title: Phishing Attack

How it Works

- Fake email or message
- Fake login website
- User enters login details
- Attacker steals the information

Who is at Risk?

- Students
- Employees
- Online shoppers
- Social media users

How to Prevent It

- Check the website URL
- Do not click suspicious links
- Use strong passwords
- Enable two-factor authentication (2FA)
- Keep software updated
